

IPA 70

Description

Isopropanol 70%.

Application and Dosage Rates

REFER TO THE SAFETY DATA SHEET BEFORE USING THIS PRODUCT.

BREWERY USAGE

A 70% solution of isopropyl alcohol is the most effective concentration for disinfecting. The presence of water is a crucial factor in destroying or inhibiting the growth of pathogenic microorganisms with isopropyl alcohol. Water acts as a catalyst and plays a key role in denaturing the proteins of vegetative cell membranes. 70% IPA solutions penetrate the cell wall more completely which permeates the entire cell, coagulates all proteins, and therefore the microorganism dies. Extra water content slows evaporation, therefore increasing surface contact time and enhancing effectiveness. Isopropyl alcohol concentrations over 91% coagulate proteins instantly. Consequently, a protective layer is created which protects other proteins from further coagulation. Solutions > 91% IPA do kill bacteria, but sometimes require longer contact times for disinfection, and enable spores to lie in a dormant state without being killed. To achieve the optimum 70% solution, mix 700ml isopropanol with 300ml of water to make a 1L solution. Use this solution through a spray bottle and allow surfaces to air dry. Where spraying is not possible, the isopropanol can be applied by pouring it onto a clean cloth/tissue and wiping the surface with the wetted material.

PRODUCT CODE

1216 / 70

PACKAGING

25 Litres

STORAGE

Store in original container.

Keep away from oxidising agents.

Recommended storage temperature 10-15 Degrees C.

Store away from direct sunlight.

Do not allow to freeze.

SHELF LIFE

Use within 24 months from the date of manufacture.

REVISION NUMBER 001
REVISION DATE 10/02/2026
