

MASHTREAT

Description

Mashtreat is a blend of calcium sulphate and calcium chloride, used to increase mineral content of brewing liquor to produce the desired beer characteristics.

Benefits

- Reduces the pH during mashing and wort boiling which improves enzyme activity
- Promotes the precipitation of unwanted proteins in the kettle, hop back or whirlpool
- Improves health and vigour of the yeast
- Improves extract yield, fermentability and wort runoff
- Reduces risk of infection
- Reduces extraction of undesirable silicates, tannins and polyphenols
- Reduces beerstone and can prevent gushing in beer
- Improves beer fining performance
- Promotes head retention on beer
- Adds chloride which imparts palate fullness
- Adds sulphate which give beer a drier and more bitter effect

Application and Dosage Rates

Mashtreat is normally added to the grist prior to mashing but can be split across the mash and sparge liquor. To achieve best results, we recommend any salts dosage more than 75g/ hl be added 2/3 with the grist and 1/3 with the sparge. This will maintain an even distribution of calcium and help maintain pH levels throughout the mash and sparge.

Mashtreat should NOT be added to the hot liquor tank (HLT), as some constituents are insoluble. They will remain in the hot liquor tank as opposed to being released into the grist, thus requiring the HLT to be cleaned on a regular basis.

Rates of use

Rates of Mashtreat should be determined based on the final brew-length and are dependent on the levels of calcium, sulphate and chloride present in your untreated liquor. Levels of the relevant ions present in your liquor can be obtained from your Local Water Authority.

PRODUCT CODE

1528

PACKAGING

20 Kg

STORAGE

Store in original container.

Recommended storage temperature 20 Degrees C.

Store away from direct sunlight.

Do not allow to freeze.

SHELF LIFE

Use within 24 months from date of the date of manufacture.

REVISION NUMBER 1

REVISION DATE 23/01/2026

Please note, Local Authority reports can provide results that are not up to date and may affect your calculations for ideal dosage rates. Alternatively, send Niche Solutions a 2L liquor sample for a full analysis. It is advisable to check the analysis of your water at least once a year, or on a more regular basis if the supply changes.

Once you have obtained your analysis of your raw liquor you can then calculate your dosage rates by selecting which beer type you wish to brew and refer to table 1, this will help you determine how many ions to add. 9g of Mashtreat per hl of your brew-length increases calcium levels by 20.7 ppm and increases chloride levels by 8.4 ppm and sulphate levels by 38.4 ppm.

Knowing this information, you can calculate the amount of NWB needed to increase the relevant ions to the ideal level.

Storage and shelf life

- Store out of extreme temperatures and away from direct sunlight
- Keep in original container
- Keep containers sealed when not in use
- Contact SKY AGRO if label is removed
- The shelf life is 2 years
